

Multilingual NLP

The Multilingual FrameNet Corpus [\[arxiv\]](#)

Beatrice Fiumanò, Nicolas Lazzari, Simone Paolo Ponzetto, Valentina Presutti

Unifies fragmented FrameNet-style resources into one compatible multilingual corpus, enabling stronger multilingual/cross-lingual frame-semantic parsing.

Builds the Multilingual FrameNet Corpus (mFNC) by harmonizing Berkeley FrameNet with nine FrameNet-like corpora (pt-BR, zh, nl, fr, de, it, ko, lv, sv) so frames/roles and conventions match across languages, and releases the corpus plus trained parsers. Normalize all datasets into a shared Berkeley-FrameNet-anchored schema/format, then train frame-semantic parsers in multilingual and cross-lingual regimes so models share signal across languages instead of learning dataset-specific quirks. Models trained on mFNC outperform prior SOTA in both multilingual and cross-lingual settings, showing gains come from true label/convention compatibility (harmonization), not just more data; releases make results reproducible.

LëtZCross: A Cross-Lingual Page-Level Benchmark for Multimodal Retrieval over Luxembourgish Documents [\[arxiv\]](#)

Omar El Bachyr, Fred Philippy, Laura Maria Bernardy, Saad Ezzini, Jacques Klein, Tegawende Bissyande

A realistic cross-lingual PDF retrieval benchmark for Luxembourgish shows page-image retrieval beats OCR pipelines and that fine-tuning language choice strongly affects transfer.

Introduces LëtZCross: page-level retrieval over Luxembourgish PDFs indexed as page images, with queries in EN/FR/DE/LB and both text-centric and visually grounded questions to stress layout/table/figure matching. Evaluate OCR text retrievers vs ColPali-style page-image retrievers under cross-lingual querying; study adaptation via single-language vs multilingual fine-tuning and measure transfer to Luxembourgish queries. Page-image retrievers outperform OCR-based retrievers across all query languages; fine-tuning transfers across languages (French is best single-language proxy on average for Luxembourgish), while multilingual fine-tuning that includes Luxembourgish yields the strongest overall and Luxembourgish-specific gains.

Rank Reversal in Multilingual LLM Judges: A Label-Free Double-Centering Calibrator [\[arxiv\]](#)

Alhasan Mahmood, Samir Abdaljalil, Hasan Kurban

! Summary may contain inaccuracies: The summary claims CBC “removes language-specific judging bias.” The abstract describes estimating and subtracting the language–backbone interaction term (a language-by-backbone effect), not a generic language-specific bias term. This is a different object (main language effect vs interaction).

Multilingual LLM judges can reverse model rankings by prompt language; a simple label-free double-centering calibration removes this bias and stabilizes rankings while improving human agreement.

Diagnoses systematic language–backbone interaction as the source of rank reversal and proposes Consensus-Based Calibration (CBC), a label-free estimator/subtractor of that interaction equivalent to two-way ANOVA double-centering, with supporting theory and bounds. Model judge scores as task difficulty + backbone skill + language×backbone interaction; estimate interaction by double-centering the multilingual mean-score matrix (row/column sums to zero), subtract it, then recompute rankings; provide finite-sample concentration and unbiasedness results even with extra task–language effects. On 7,920 runs (6 backbones, 8 languages, 55 tasks, 3 frameworks), raw judging shows top backbone changes by language and 7/15 backbone pairs have significant rank reversal; CBC boosts held-out rank consistency (Kendall’s τ) 0.6500.902, matches an additive-model oracle in 100% per-language decisions (vs 68.5% raw), and improves human agreement on M-RewardBench 68.7%76.6% (+7.9 pp, 95% CI [6.0, 9.9]).

The Geometry of Low-Resource Language Representations [\[arxiv\]](#)

Francois Meyer, Jan Buys

Shows low-resource languages have more collapsed final-layer representation geometry in multilingual LLMs, and geometry-regularized continued pretraining can modestly narrow gaps on harder tasks.

Links multilingual performance disparities to a measurable internal failure mode—representational degeneration for low-resource languages (especially late layers)—and demonstrates targeted geometric regularizers as an intervention during continued pretraining. Measure layerwise geometric statistics across 30 languages and relate them to resource level; during monolingual CPT on 10 African languages, add degeneration-penalizing regularizers (notably a cosine-similarity term) and test across 9 base LLMs. Low-resource languages show consistent late-layer collapse; regularized CPT reliably reduces degeneration, and for larger models the cosine regularizer yields small but consistent gains over vanilla CPT, most evident on the hardest downstream tasks.

Multilingual Speech Processing

Bulbul: A Dataset for Dialectal Arabic Speech Recognition [\[arxiv\]](#)

Ahmed Ashraf, Aisha Alansari, Fadel Al Abbas, Nada Almarwani, Samah Aloufi, Saad Ezzini, Maged S. Al-Shaibani, Doaa Dalaq, AbdelRahim A. Elmadany, Muhammad Abdul-Mageed, Mohamed Mehdi Trigui, Dania Refai, Layan Refai, Mohamed Akrouf, Mustafa Jarrar, Wasfi G. Al-Khatib, Alaa Dalaq, Darin El-Nakla, Samir Abdaljalil, Abdulrahman Al-Fakih, Nour El Imane Zeghib, Moussa Redah, Salmane Chafik, Mohamed El-Attar, Rima Grati, Sarah Kohail, Malak Alkhorasani, Khadijah Al Safwan, Ismail M. Mudhaffar, Ali Altam, Ahmed Al-Shaikh, Adnan Saeed, Hamzah Luqman

Provides a verified, multi-dialect Arabic speech dataset with structured coverage, enabling more realistic and comparable dialectal/accented ASR research.

Releases BULBUL: speech from 275 speakers across 11 Arab countries covering dialects/sub-dialects, plus Classical Arabic and MSA spoken with native dialectal accents, with two-level human verification to balance diversity and label quality. Collect controlled multi-country recordings (not web/broadcast scraping), include dialectal + CA/MSA-with-accent from the same speakers to study accent effects, apply two-stage human verification, and benchmark multiple modern ASR systems to set baselines. Baseline ASR evaluations show BULBUL is consistent enough for meaningful comparisons while capturing real dialect/accent variation; results highlight that “standard” Arabic recognition must handle accent, and BULBUL fills the gap between narrow single-dialect sets and noisier large-scale corpora.

WnW: Waxing-and-Waning KV Cache for Long-Form Speech LLMs [\[arxiv\]](#)

Yiming Yao, Chenyang Lyu, Xuanfan Ni, Longyue Wang, Weihua Luo, Yazheng Yang, Jinsong Su

Fixes long-form speech LLM KV-cache compression by letting decode-time attention drive what audio to recall, avoiding the prefill-only importance mismatch.

Identifies why prefill-ranked KV eviction fails on long audio (prefill attention sinks to early audio, but decoding later needs dispersed info) and proposes WnW: keep a small decode-time ‘observer’ on GPU and recall evicted audio KV chunks from CPU when needed. Offline-calibrate heads into anchor/tidal/fixed: anchor heads keep audio KV on GPU and provide decode-time importance via attention; tidal heads store more KV on CPU and are dynamically recalled (“wax/waning” GPU cache) based on anchor signals; fixed heads use conventional permanent compression. On LibriSpeech-Long with Voxtral-mini-3B and Qwen2.5-Omni-3B, WnW matches near-full-cache accuracy while keeping ~20% of audio tokens on GPU; prefill-only baselines can become brittle (even failing to terminate), while WnW stays stable under shifts with little added decode overhead.

Foundation Model Theory

The Communication Map of a Transformer [\[arxiv\]](#)

Richard Zhe Wang

Derives a weight-only ‘communication map’ of transformer read/write pathways and uses it to causally disrupt induction by deleting a tiny residual subspace.

Defines a unified coupling coefficient (generalizing composition scores) to quantify residual-stream write–read compatibility across 18 connection types (headhead, MLPhead, neuron-level, etc.), enabling scalable discovery of likely circuits without activations. Compute alignment between each component’s output projection (writer) and another’s input projections (reader) from weights; apply an orientation test to separate structured couplings from chance; cluster strong couplings and perform targeted ablations; aggregate cou-

plings to identify induction-critical residual subspaces and delete them. A large share of head pairs (70–89%, model-dependent) show non-chance oriented coupling; top couplings recover known induction circuits and ablating a coupled community collapses in-context copying; deleting a discovered 2D residual subspace abolishes induction across six models up to Pythia-6.9B.

Field Overview

Today’s batch is dominated by LLM agents + retrieval + evaluation/safety: at least ~35–45 papers touch RAG/agent systems (e.g., multi-hop RAG evaluation, tool routing, long-horizon memory, enterprise RAG, agent benchmarks), with a noticeable subcluster on agent memory and context management alone (~10–15: Dual-Layer Agentic Memory, ECHO, MegaMem, MEMONDEMAND, compaction cliff, retriever-should-remember, etc.). Safety/reliability is the other major pillar: roughly ~25–35 papers on jailbreaks/prompt injection, content moderation, uncertainty/calibration, unlearning/privacy leakage, and governance/auditing (e.g., Agentic Security, EviSafe, PsychJail, multiple unlearning papers, AIREP/HANSARD/AUDITA). A third strong theme is multilingual/low-resource + cultural grounding (~15–25 papers) spanning Khmer, Nigerian Pidgin, Bangla/Bengali safety, Cyrillic tokenization/QA, Luxembourgish retrieval, Polish multimodal benchmarks, Arabic dialect resources/detox/redteaming, and cross-lingual alignment/judging. Some emerging directions: diffusion/flow language models and decoding/control show up as a coherent cluster (~10–15: flow-matching LMs, diffusion MT, convergence-aware inference, suffix modeling, self-distillation), and “measurement/benchmark fragility” is unusually prominent (~8–12 papers critiquing harnesses, noise floors, judge instability, compute-vs-impact, and what process evaluation actually measures).
